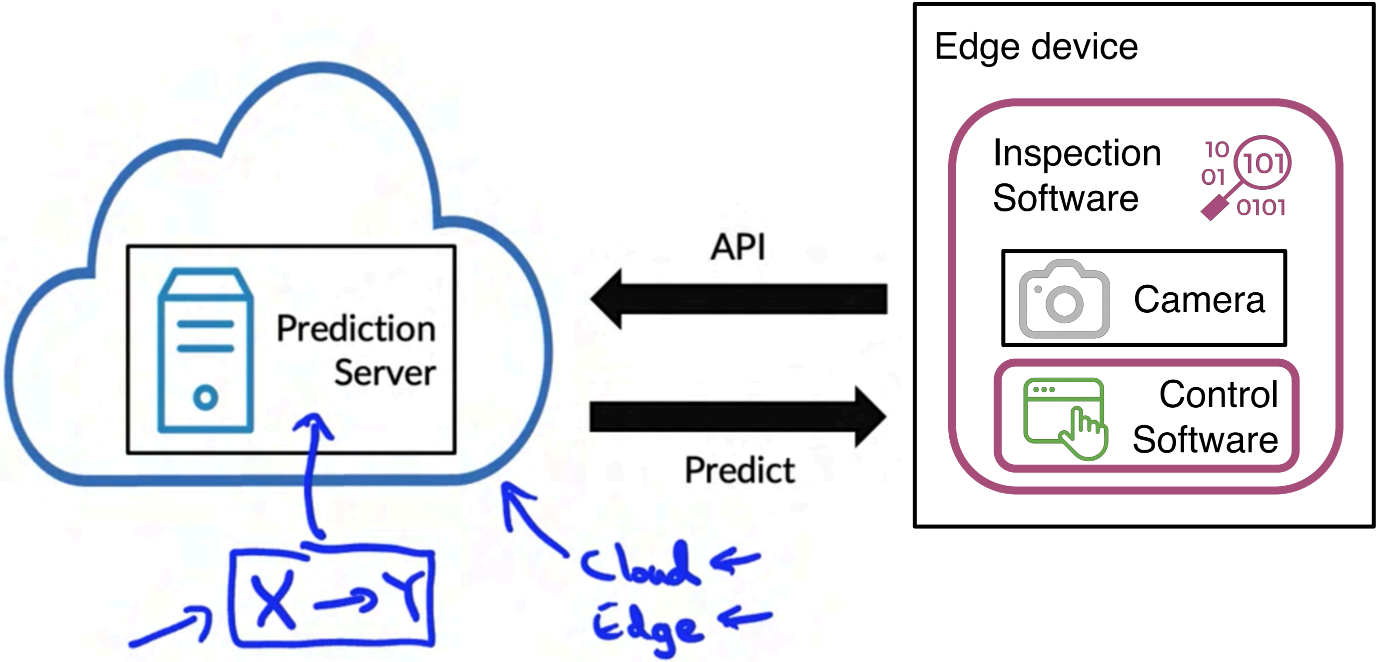
DeepLearning.AI

The Machine Learning Project Lifecycle

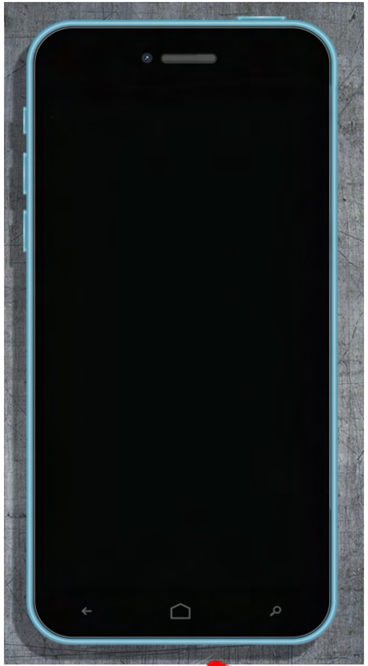
Welcome

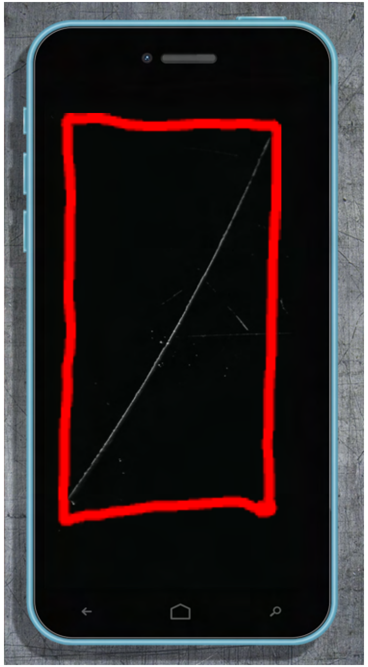
Deployment example

Photo from camera

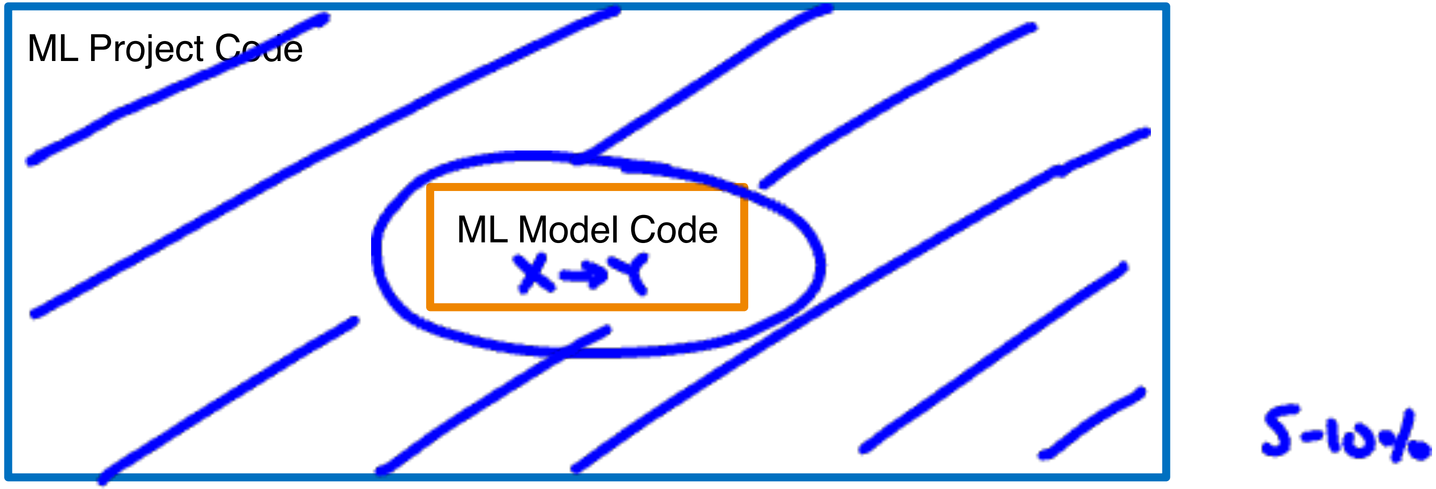


Visual inspection example



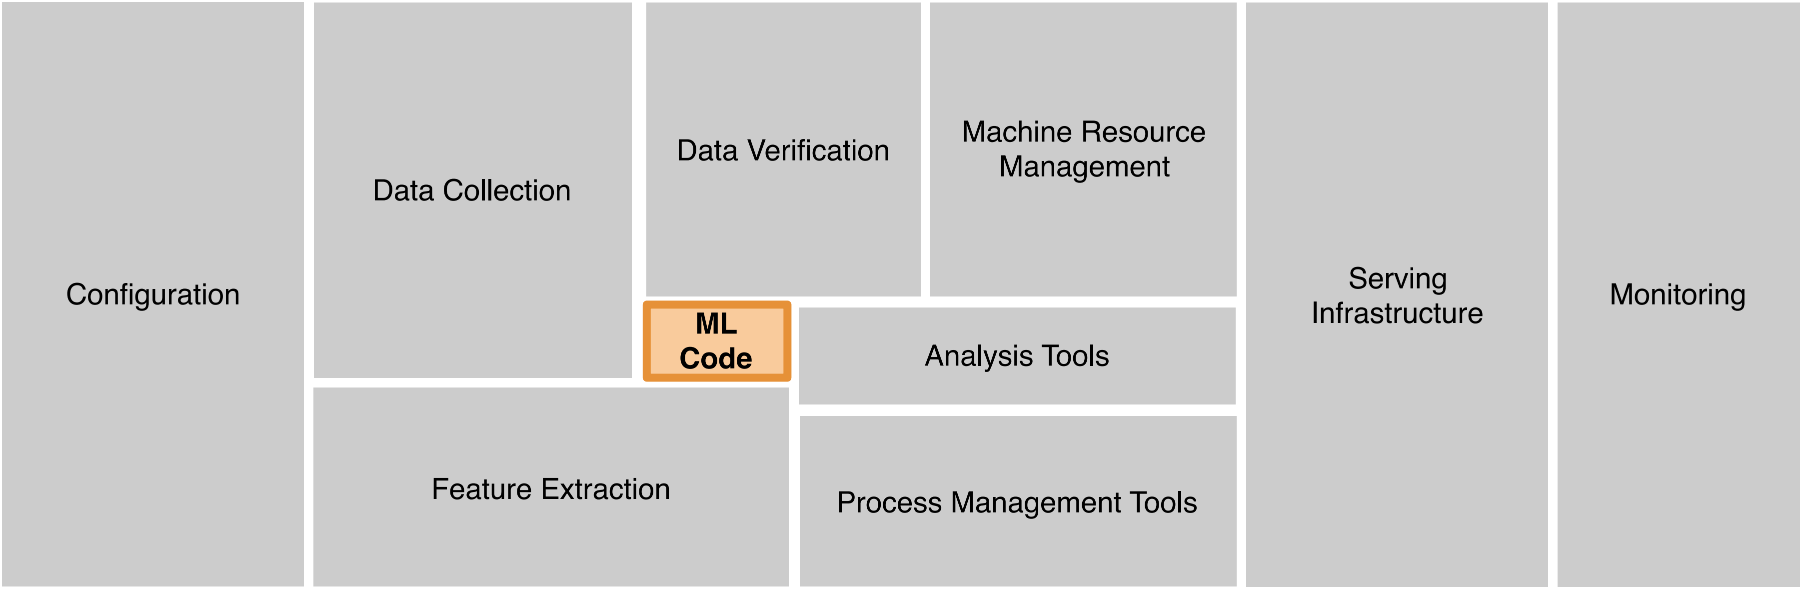


ML in production



"POC to Production Gap"

The requirements surrounding ML infrastructure



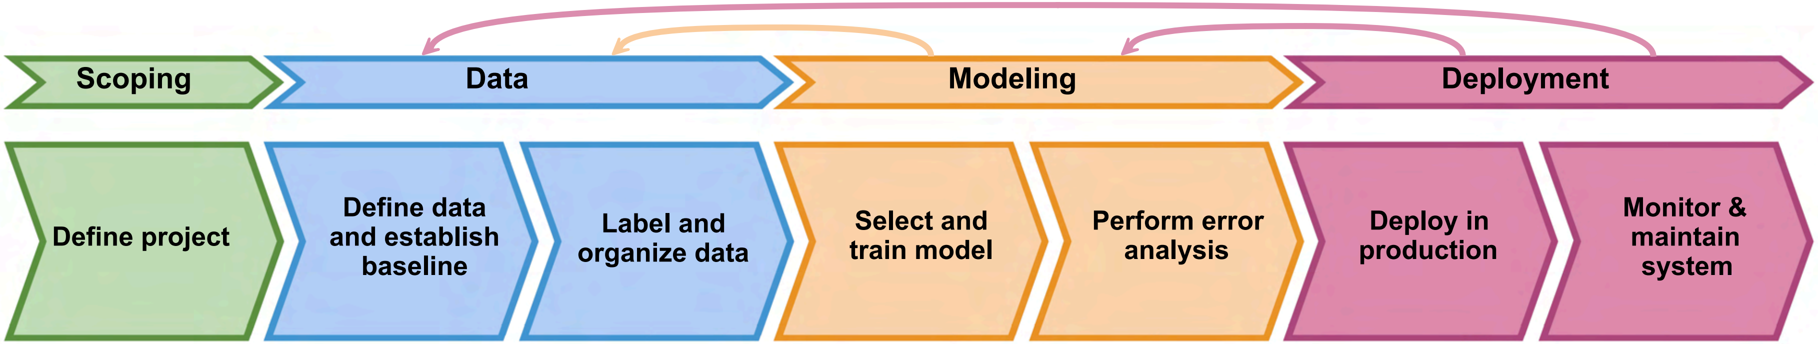
[D. Sculley et. al. NIPS 2015: Hidden Technical Debt in Machine Learning Systems]

DeepLearning.AI

The Machine Learning Project Lifecycle

Steps of an ML project

The ML project lifecycle



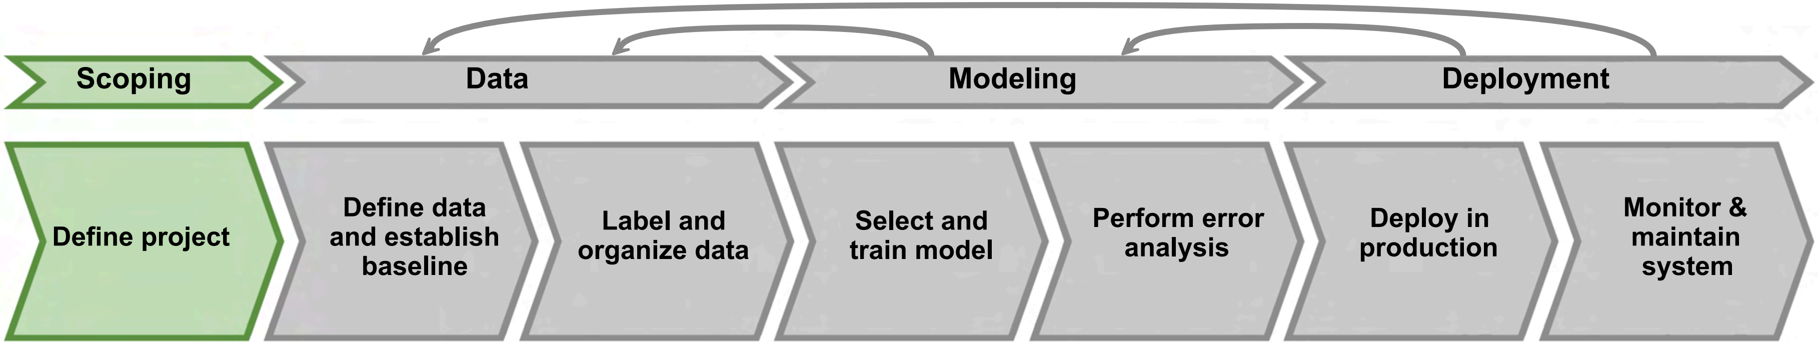
$X \to Y$

DeepLearning.AI

The Machine Learning Project Lifecycle

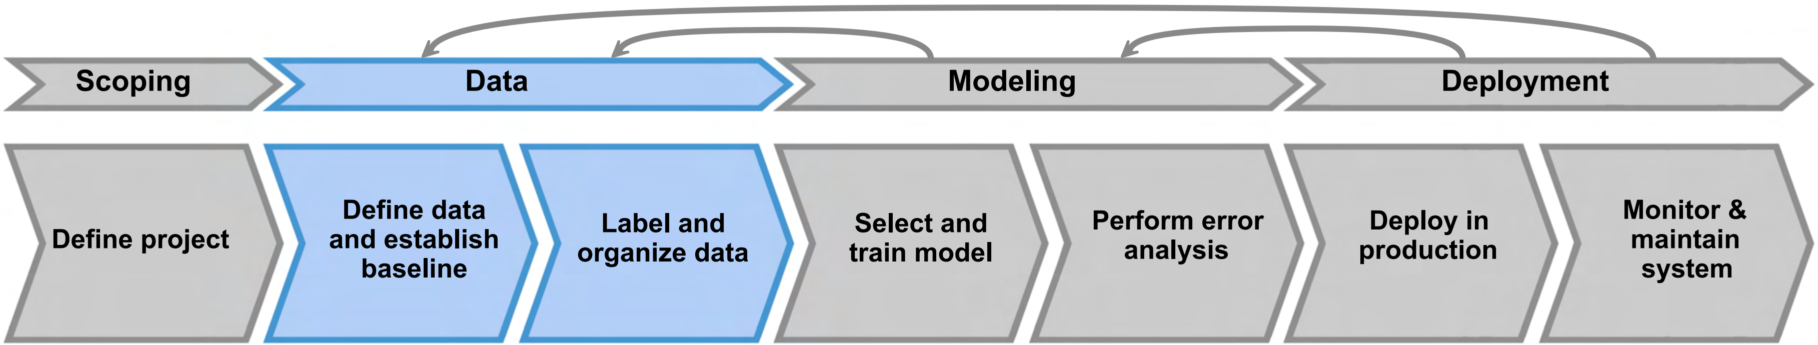
Case study:
speech recognition

Speech recognition: Scoping stage



- Decide to work on speech recognition for voice search.
- Decide on key metrics:
    - Accuracy, latency, throughput
- Estimate resources and timeline

Speech recognition: Data stage



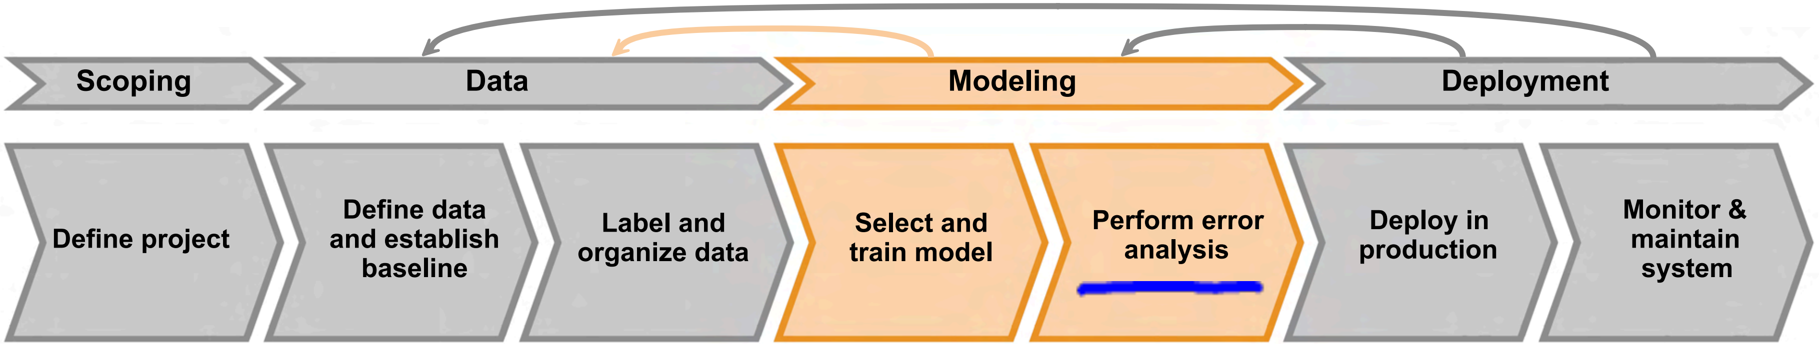
Data definition problem
systematic framework to ensure data quality

Define data

- Is the data labeled consistently?
- How much silence before/after each clip? 100ms 300ms 500ms
- How to perform volume normalization?

"Um, today's weather"
"Um… today's weather"
"Today's weather"

Speech recognition: Modeling stage



Research/Academia

Product Team

Code (algorithm/model)

Hyperparameters

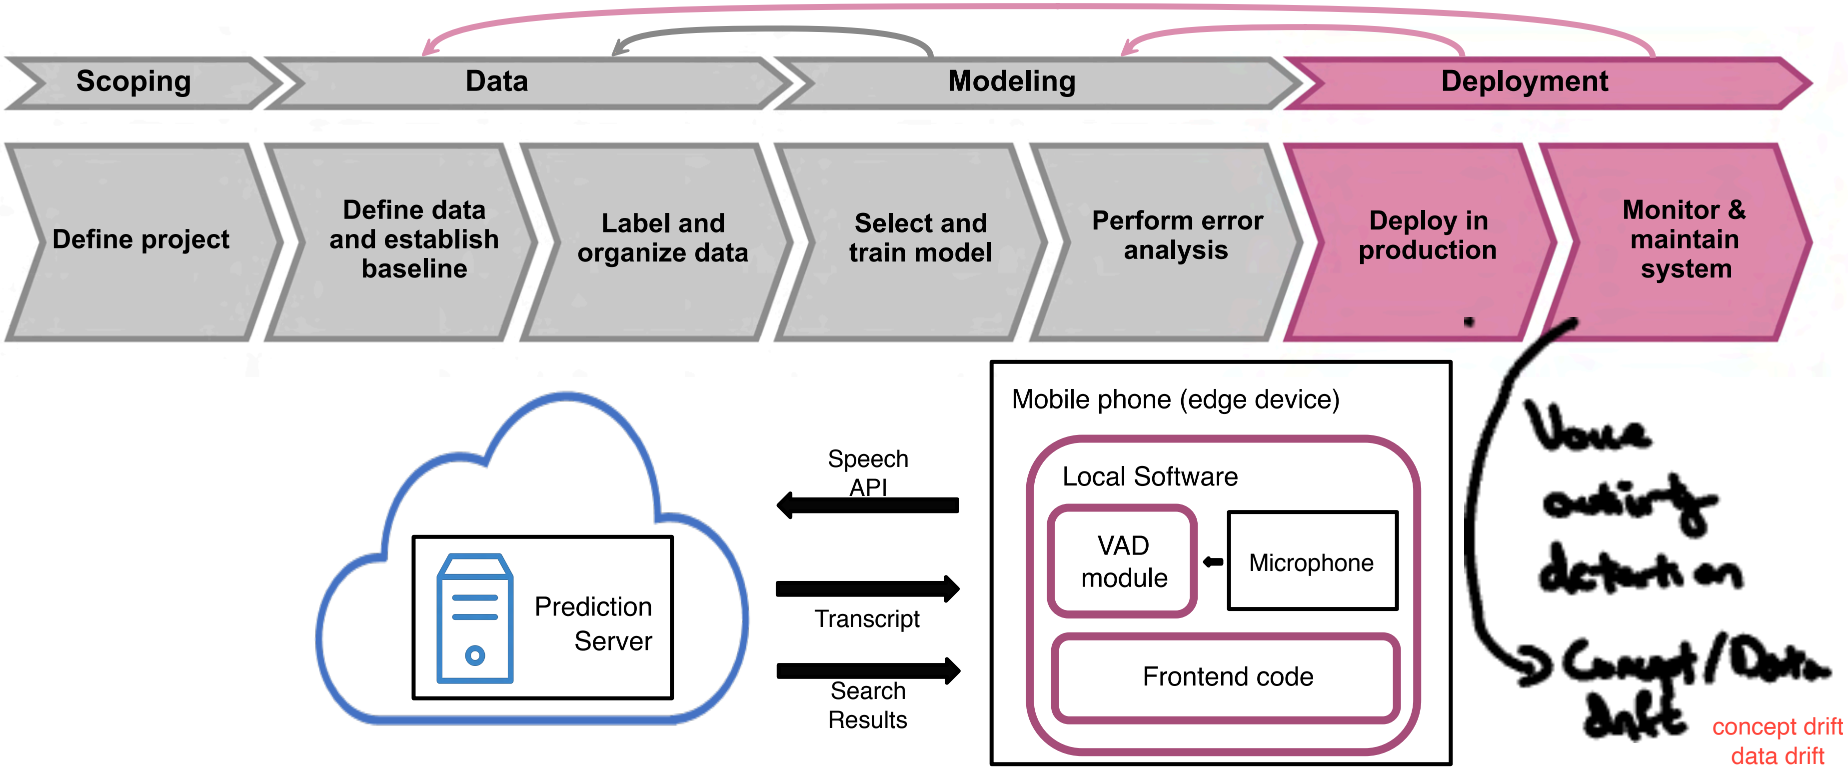
Data

ML Model

X → Y

ML System = Code + $\boxed{\text{Data}}$

Speech recognition: Deployment stage

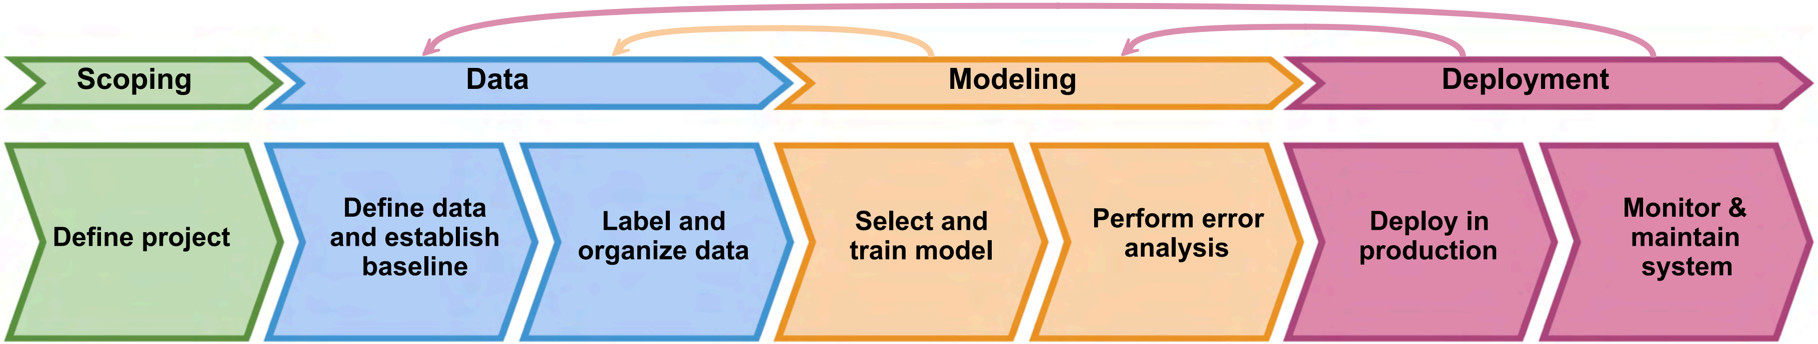


DeepLearning.AI

The Machine Learning Project Lifecycle

Course outline

Course outline



1. Deployment
2. Modeling
3. Data

Optional: Scoping

MLOps (Machine Learning Operations) is an emerging discipline, and comprises a set of tools and principles to support progress through the ML project lifecycle.

DeepLearning.AI

Deployment

Key challenges

the desire mapping of x -> y changes

Concept drift and Data drift

x -> y   x   the distribution of input x changes

Speech recognition example

Training set: x -> y

- Purchased data, historical user data with transcripts

Test set:

- Data from a few months ago

Gradual change
Sudden shock

How has the data changed?

gradual change
sudden shock

Software engineering issues

Checklist of questions

- Realtime or Batch
- Cloud vs. Edge/Browser
- Compute resources (CPU/GPU/memory)
- Latency, throughput (QPS)
- Logging
- Security and privacy

500ms, 1000 QPS

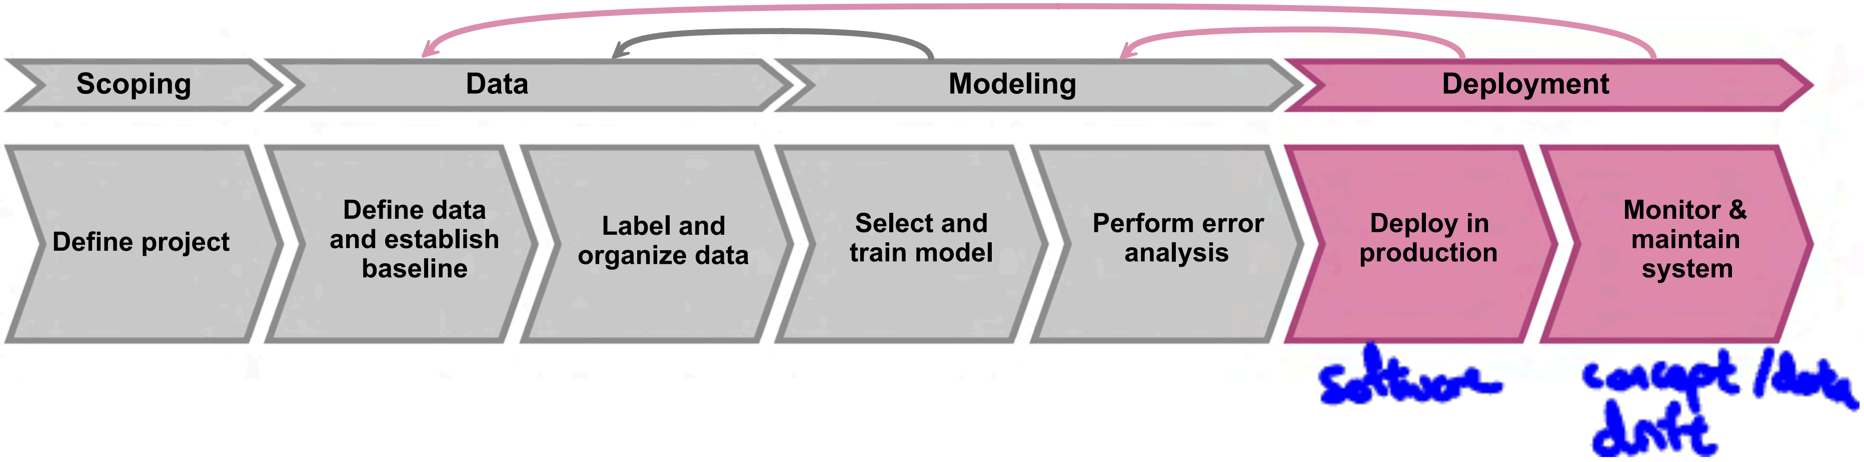
Throughput refers to the rate at which a system or network can process or transmit data within a given period of time

Query per second (QPS) -> how much do we need to handle

for analysis and review

for retraining

First deployment vs. maintenance



DeepLearning.AI

Deployment

Deployment patterns

Common deployment cases

1. New product/capability
2. Automate/assist with manual task

shadow mode deployment

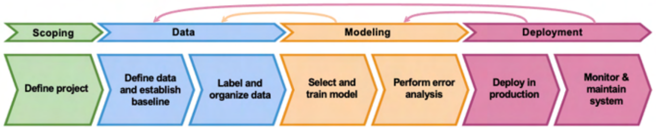
3. Replace previous ML system

Key ideas:

- Gradual ramp up with monitoring
- Rollback

Visual inspection example

shadow mode



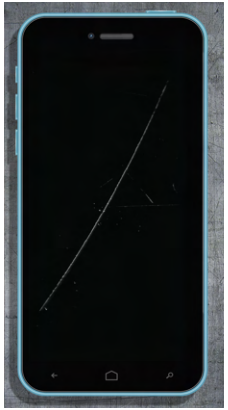
shadow mode deployment

Human

✓

ML

✓

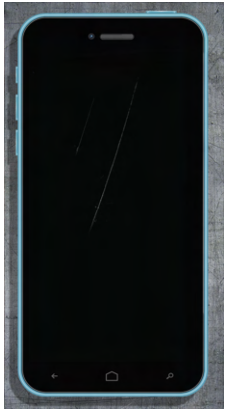


Human

✗

ML

✗



Human

✗

ML

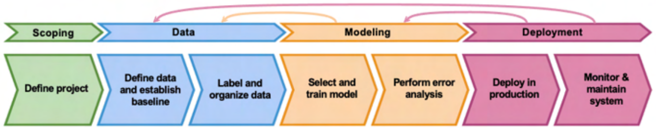
✓

ML system shadows the human and runs in parallel.

ML system's output not used for any decisions during this phase.

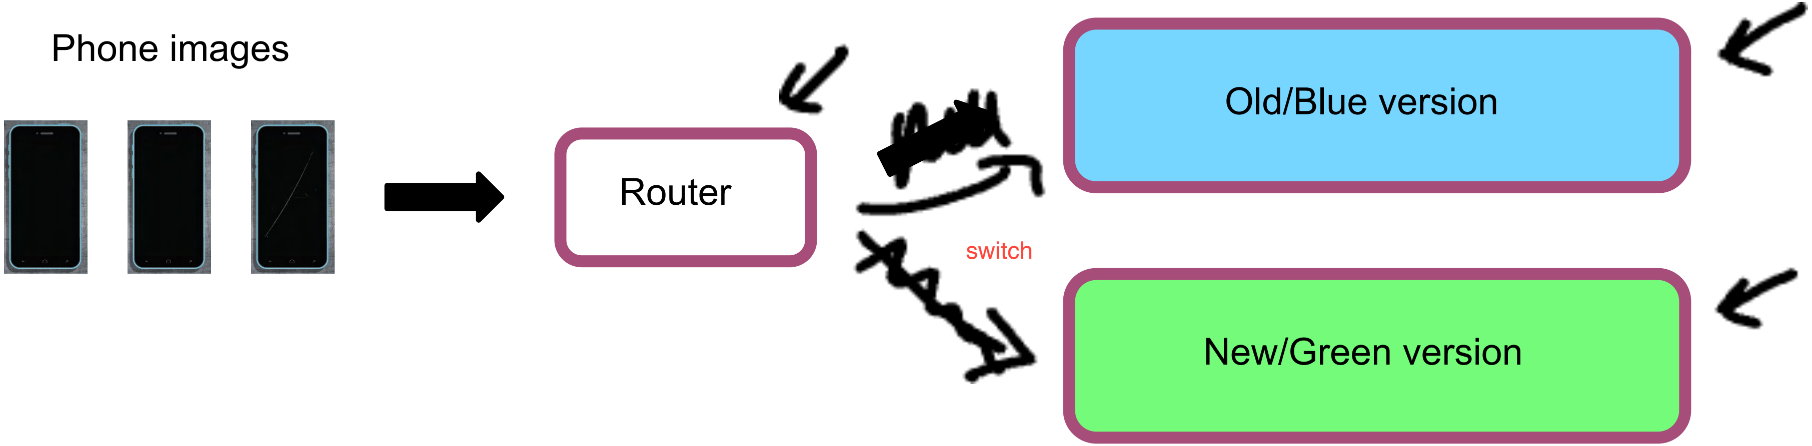
Sample outputs and verify predictions of ML system.

Canary deployment



- Roll out to small fraction (say 5%) of traffic initially.
- Monitor system and ramp up traffic gradually.

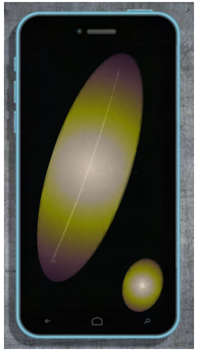
Blue green deployment

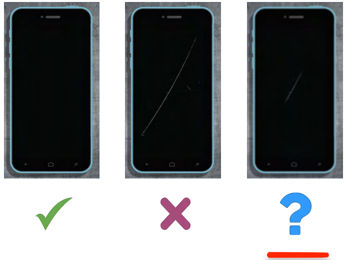


Easy way to enable rollback

Degrees of automation

human





Human

AI

UI design is crucial here

Human only → Shadow mode → AI assistance → Partial automation → Full automation

human in the loop

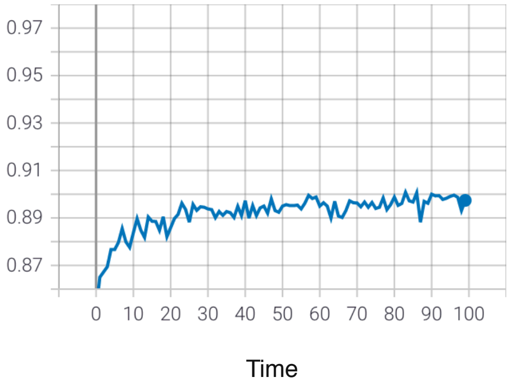
You can choose to stop before getting to full automation.

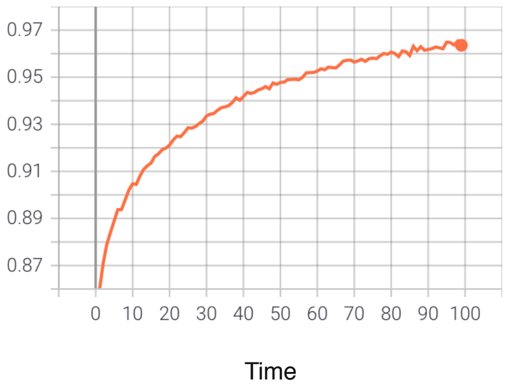
DeepLearning.AI

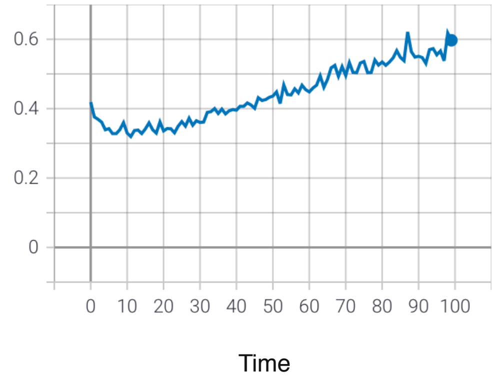
Deployment

Monitoring

Monitoring dashboard





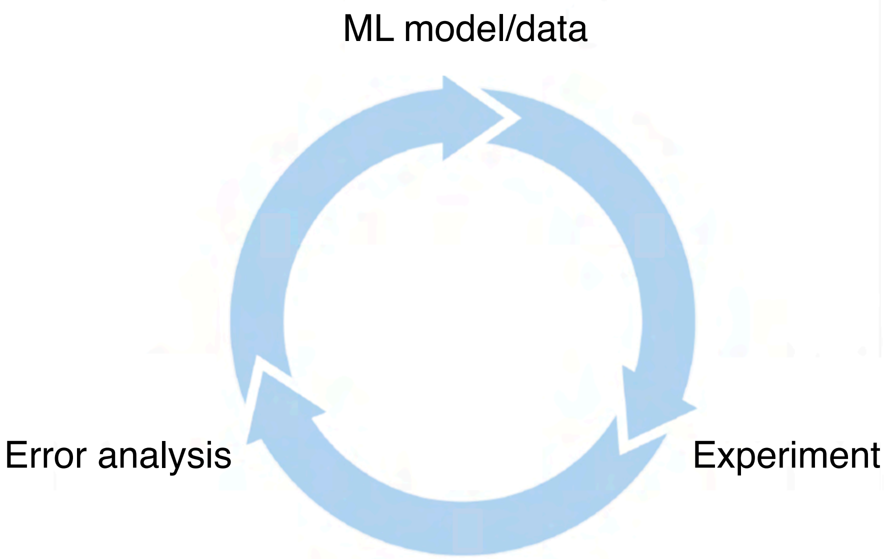


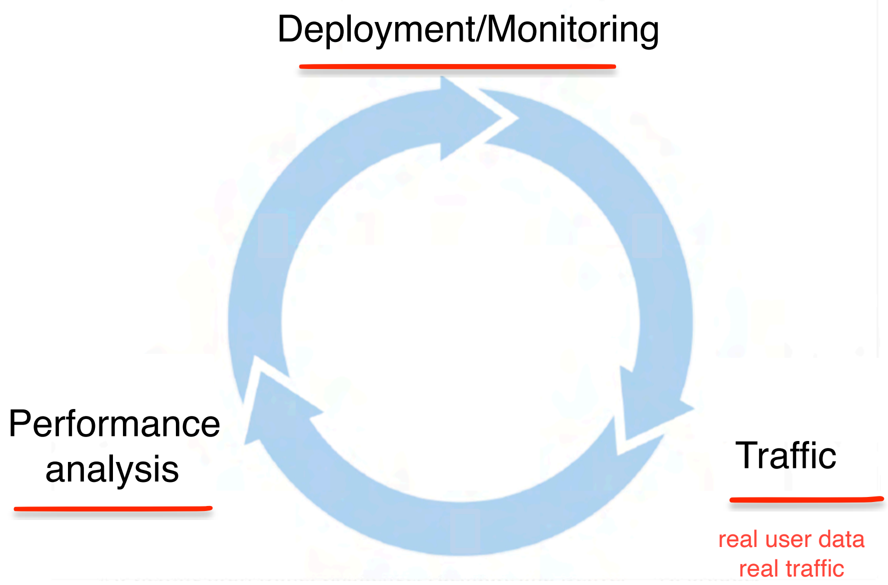
- Brainstorm the things that could go wrong.
- Brainstorm a few statistics/metrics that will detect the problem.
- It is ok to use many metrics initially and gradually remove the ones you find not useful.

Examples of metrics to track

Software metrics:	Memory, compute, latency, throughput, server load
Input metrics: x	Avg input length Avg input volume Num missing values Avg image brightness
Output metrics: y	# times return " " (null) # times user redoes search # times user switches to typing CTR for web search or sth

Just as ML modeling is iterative, so is deployment

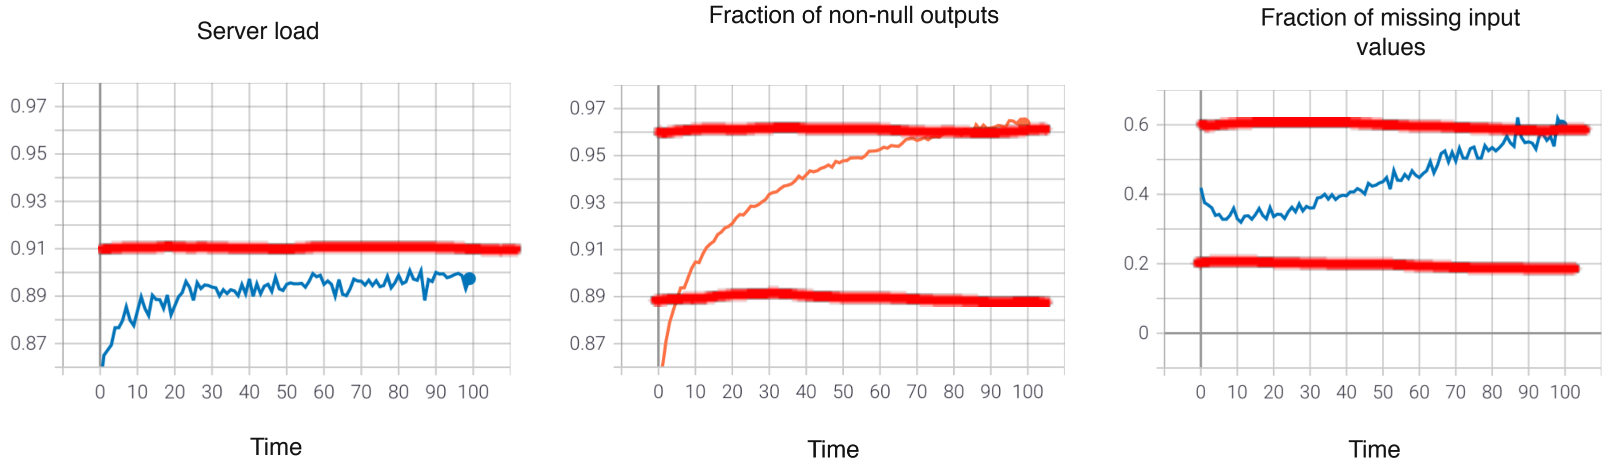




Iterative process to choose the right set of metrics to monitor.

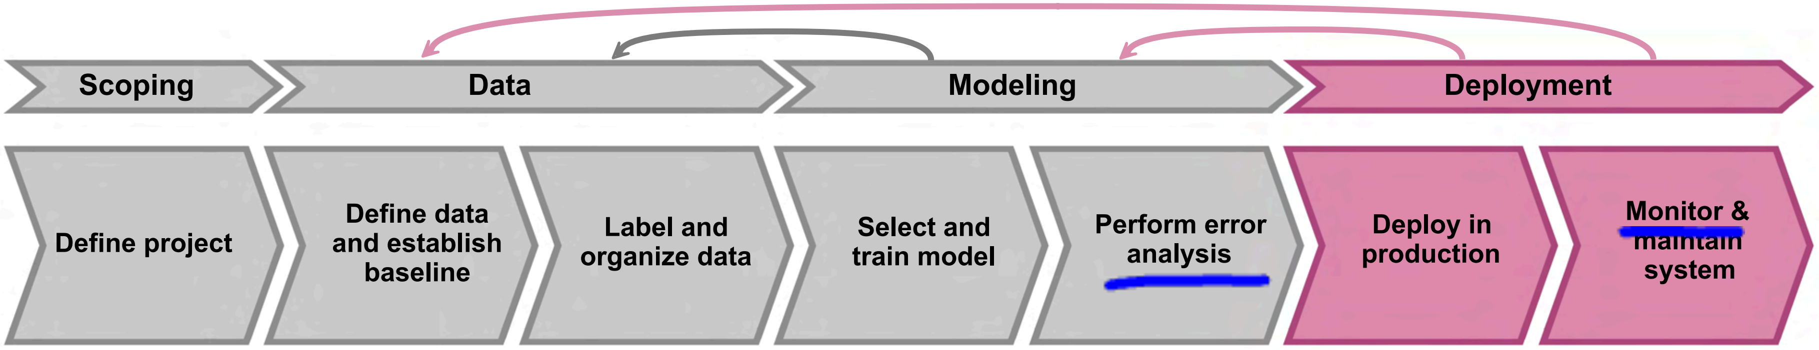
add/remove

Monitoring dashboard



- Set thresholds for alarms
- Adapt metrics and thresholds over time

Model maintenance



- Manual retraining
- Automatic retraining

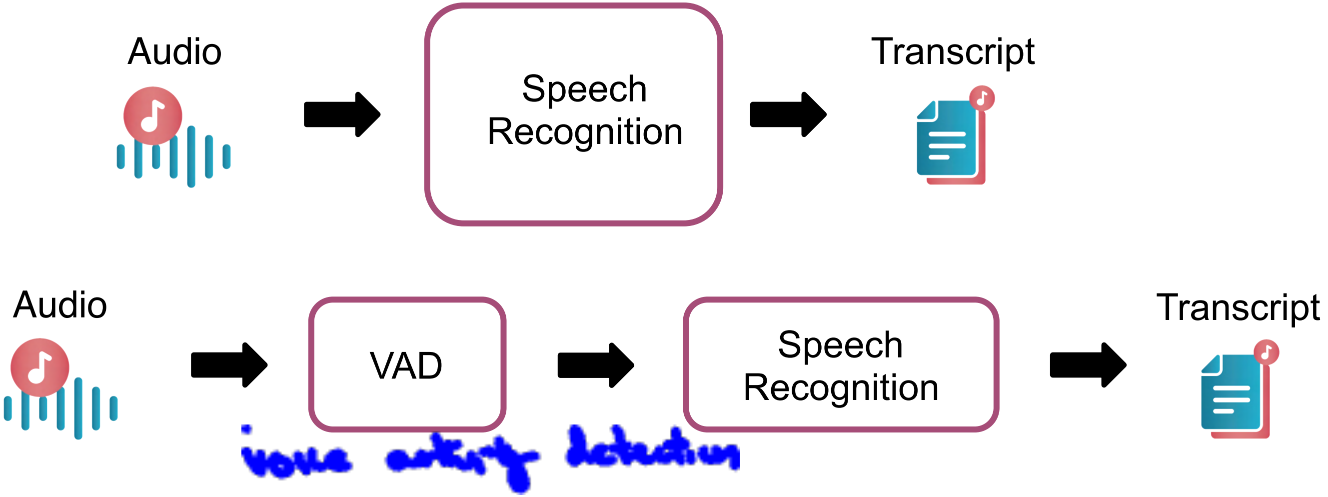
more common

DeepLearning.AI

Deployment

Pipeline monitoring

Speech recognition example



voice activity detection

Some cellphones might have VAD clip audio differently, leading to degraded performance

User profile example

User Data → User Profile → Recommender system → Product recommendations

(e.g., clickstream)

(e.g., own car?)

y

n

unknown

Metrics to monitor

Monitor

- Software metrics
- Input metrics
- Output metrics

How quickly do they change?

- User data generally has slower drift.
- Enterprise data (B2B applications) can shift fast.
